This App vs Odoo — Feature Gap, Workflow Gap, and What Launch Actually Requires

Companion to [REVIEW.md](#) and [ROADMAP.md](#). Baseline for comparison: **Odoo Community + Enterprise (Accounting, Invoicing, Sales, Purchase, Inventory) with the Indian localization l10n_in**, as of mid-2026. Verify Odoo pricing and India e-Invoice/e-Way-bill module coverage against Odoo's current site before quoting any of it to a customer — that layer changes release to release.

A note on framing before the tables: Odoo is a 15-year-old ERP with thousands of modules and a full framework (ORM, workflow engine, report writer, studio, app store). **Feature parity is not a goal worth having.** The useful questions are (a) which gaps block a paying customer, (b) which gaps are structural rather than missing screens, and (c) where this app can be *better* than Odoo rather than smaller. Sections 1–3 answer (a) and (b), Section 5 answers (c).

Legend: **Yes** = works today · **Partial** = present but incomplete or client-only · **No** = absent.

1. Capability scorecard

1.1 CUSTOMER SIDE (ORDER TO CASH)

Capability	Odoo	This app	Gap
Quotations / estimates	Yes	Partial (local only)	Medium
Sales orders as a distinct, confirmable document	Yes	No (estimate jumps straight to invoice)	Large
Customer invoices	Yes	Partial (server-side, write-only sync)	Large
Credit notes	Yes	Partial (local only)	Medium
Delivery linked to invoice (invoice on delivered qty)	Yes	No	Large
Payment terms / due-date schedules	Yes	No (single due date)	Medium
Partial payments and payment allocation across invoices	Yes	Partial (paidAmount field, no allocation model)	Large
Follow-ups / dunning levels	Yes	No	Medium
Customer portal (view + pay online)	Yes	No	Medium
Online payment (gateway)	Yes	No	Medium
Recurring / subscription invoicing	Yes (Subscriptions)	No	Medium
Price lists, per-customer pricing	Yes	No	Medium
Multi-currency + FX revaluation	Yes	No (INR hardcoded)	Medium

Capability	Odoo	This app	Gap
Invoice PDF templates	Yes	Yes (jspdf, template picker)	None
Email the invoice from the system	Yes	No	Medium
CRM pipeline	Yes	No	Low (out of scope)

1.2 VENDOR SIDE (PROCURE TO PAY)

Capability	Odoo	This app	Gap
RFQ → purchase order	Yes	Partial (PO exists, no RFQ stage)	Medium
Vendor bills	Yes	Partial (local only)	Large
Debit notes	Yes	Partial (local only)	Medium
Three-way match (PO ⇔ receipt ⇔ bill)	Yes	No	Large
Bill payment + batch payments	Yes	Partial (disbursement form)	Medium
Purchase approval rules / limits	Yes	No	Medium
Vendor price lists, blanket orders	Yes	No	Low
Vendor portal	Yes	No	Low

1.3 ACCOUNTING CORE — THE STRUCTURAL GAP

Capability	Odoo	This app	Gap
Double-entry general ledger (immutable journal items)	Yes	No — postings derived at render time from vouchers	Critical
Journals (sales, purchase, bank, cash, misc)	Yes	Partial (single journalEntries array)	Large
Chart of accounts with country templates	Yes	Yes (templated groups/types)	None
Control accounts referenced by ID	Yes	No — matched by name string (“accounts receivable”)	Critical
Posted vs draft state on entries	Yes	No	Large
Period lock / fiscal year close	Yes	No	Critical
Year-end closing + opening balance carry-forward	Yes	No	Large
Inalterability / audit hash chain (required by several tax authorities)	Yes	No	Large
Bank statement import (CSV/OFX/MT940)	Yes	No (bankTransactions array exists, nothing fills it)	Large
Bank reconciliation UI + matching rules	Yes	No	Large
Analytic accounting (cost centres, projects)	Yes	No	Medium
Assets register + depreciation schedules	Yes	No	Medium
Deferred revenue / prepaid expense schedules	Yes	No	Medium
Budgets	Yes	No	Low

Capability	Odoo	This app	Gap
Trial Balance, P&L, Balance Sheet, Cash Flow	Yes	Partial (computed from derived postings)	Medium
Aged receivable / payable	Yes	No	Medium
Day book / general ledger drill-down	Yes	Partial (LedgerView)	Medium
Multi-company consolidated reporting	Yes	No	Medium

Read this table as one finding, not eighteen. Everything marked Critical traces to the same root cause: there is no ledger. Odoo's reports are queries over `account.move.line`; this app's reports are recomputations over vouchers.

1.4 INVENTORY

Capability	Odoo	This app	Gap
Multi-warehouse	Yes	Yes (server-side <code>Warehouse</code> + access control)	None
Multi-location / bins inside a warehouse	Yes	No	Medium
Inter-branch / inter-warehouse transfer with state machine	Yes	Yes (DRAFT→SENT→RECEIVED, transactional)	None
Receipts / delivery orders as documents	Yes	No	Large
Lots / serial numbers, expiry	Yes	No	Medium
Inventory valuation (FIFO/AVCO/standard)	Yes	No	Large
Automated stock journal entries (COGS, stock interim)	Yes	No	Large
Landed costs	Yes	No	Low
Reordering rules / replenishment	Yes	No	Medium
Physical count / adjustment applied to stock	Yes	Partial — <code>InventoryAdjustment</code> rows are recorded but never applied to <code>StockBalance</code>	Large
Negative-stock control	Yes	No (transfers decrement without a guard)	Medium
UoM + UoM conversion	Yes	Partial (UoM master, no conversion)	Medium
Barcode operation	Yes	No	Low

Capability	Odoo	This app	Gap
Two item catalogs (server Item vs local items) reconciled	n/a	Broken — the two are disconnected	Large

1.5 INDIA / GST LOCALIZATION

Capability	Odoo (<code>l10n_in</code> + Enterprise)	This app	Gap
GSTIN on company/branch/party, validation	Yes	Yes (format + checksum + state match)	None
CGST/SGST/IGST determination by place of supply	Yes	Yes (<code>src/utils/gst.js</code> , 38 state codes)	None
GST rate masters, HSN/SAC on lines	Yes	Yes	None
GSTR-1 / GSTR-3B on-screen reports	Yes	Yes	None
GSTR-1 export in government JSON schema	Yes	No (screen only)	Large
GSTR-2A/2B download + purchase reconciliation	Yes	No	Large
e-Invoice (IRN + signed QR via IRP)	Yes	No	Large
e-Way bill generate/cancel	Yes	No	Large
TDS / TCS with sections, thresholds, challans	Yes	No	Large
Reverse charge, SEZ/export with LUT	Yes	No	Medium
Composition scheme	Yes	Partial (registration type field only)	Medium
Tally-compatible export	Third-party	No	Medium

This is the app's strongest column *and* its most dangerous one: the GST computation is genuinely good, but everything that turns a computation into a **filing** is missing.

1.6 PLATFORM AND FRAMEWORK

Capability	Odoo	This app	Gap
Multi-company	Yes	Yes (Account → Org)	None
Multi-branch inside a company	Via companies/analytic	Yes, natively	Better here
Warehouse-level user access	Partial (via groups)	Yes, natively	Better here
Role/permission model stored in DB	Yes	Yes (module/subModule/action)	None
Record-level access rules (ir.rule)	Yes	Partial (branch/warehouse scoping only)	Medium
Approval workflows / activity assignment	Yes	No (transfers only)	Large
Chatter: per-document comments, log, followers	Yes	No	Large
Document attachments (bills, receipts)	Yes	No	Large
Audit log on financial records	Yes	No (AuditLog written for users only)	Large
Email integration (send + incoming)	Yes	No (SMTP config exists in dead code)	Large
Scheduled jobs / cron	Yes	No	Medium
Import/export (CSV/XLSX) of any model	Yes	Partial (export to Excel/PDF for ledger)	Medium
Pivot/graph analysis, custom dashboards	Yes	No (fixed reports)	Medium

Capability	Odoo	This app	Gap
Custom fields without code (Studio)	Yes (Enterprise)	No	Low
Public API (XML-RPC/JSON-RPC/REST)	Yes	Partial (internal REST, undocumented, no keys)	Medium
Webhooks	Yes	No	Low
Mobile app / responsive UI	Yes	No	Medium
Offline capability	No	Accidentally yes (localStorage)	n/a
Translations / i18n	Yes (many)	No (English only)	Low
Deep links to a record (URL per document)	Yes	No (no router at all)	Medium
Printing/report designer	Yes (QWeb)	Partial (fixed invoice templates)	Medium
App marketplace / third-party ecosystem	Yes	No	n/a

1.7 SCORECARD TOTALS

Across the ~100 capabilities compared above:

Verdict	Count (approx.)
Yes — at parity	~14
Better here than Odoo	2 (native branch model, warehouse-level access)
Partial	~20
No — missing	~64

Of the missing items, roughly **15 are structural** (they need the ledger, document-flow, and attachment/audit layers to exist first) and the rest are screens and integrations that can be built once the structure is right.

2. The workflow gap — the part that matters more than the feature list

A feature checklist understates the distance, because Odoo's real product is not its screens; it is that **every business event produces a linked document and a balanced journal entry, automatically, inside one transaction**. Five flows show what that means in practice.

2.1 ORDER TO CASH

Odoo: Opportunity → Quotation → *confirm* → Sales Order (reserves stock) → Delivery Order → *validate* (stock moves post COGS + stock interim entries) → Invoice created *from the delivery, on delivered quantities* → *post* (creates `account.move` with AR debit, revenue credit, GST credit) → Payment registered → Payment matched against invoice → Bank statement line reconciled to the payment. Every document links back to the one before it; every state change is logged in chatter; the invoice cannot be edited after posting, only credited.

This app: Estimate and Invoice are two independent rows in two independent localStorage arrays. Creating an invoice does not reserve, move, or value stock. It writes a `paidAmount` number rather than a payment allocated to it. Nothing posts. The trial balance recomputes from the invoice list every time it is rendered, resolving "Accounts Receivable" by name.

Consequence: an accountant cannot answer "why did AR move by ₹X on this day" with a drill-down, because there is no entry to drill into.

2.2 PROCURE TO PAY

Odoo: RFQ → PO → Receipt (stock in, at cost, posting the stock interim account) → Vendor Bill matched against PO and receipt (three-way match, with a difference report) → Payment → Bank reconciliation.

This app: Bill and PO exist as separate local documents with no match, no receipt, and no stock or cost effect. Purchases do not change inventory value because inventory has no value — only quantity.

2.3 STOCK MOVEMENT ACCOUNTING

Odoo: every stock move can generate accounting entries under automated valuation, and the Stock Valuation report ties to the Balance Sheet.

This app: stock is quantity-only (`StockBalance.qtyOnHand`). There is no cost layer, no valuation method, no COGS posting. `Stock-in-Hand` exists as a chart-of- accounts group with nothing computing a balance for it. Adjustments are recorded but never applied.

2.4 MONTH-END CLOSE

Odoo: lock date per journal and per user group, unreconciled-items report, bank reconciliation to zero, tax report → close entry, then the period is immutable.

This app: there is no close. Every historical voucher stays editable and deletable forever, and reports recompute from whatever the vouchers say today. Two people can produce two different Marches from the same file.

2.5 TAX FILING

Odoo: tax tags on every journal item → tax report → GSTR-1/3B in filing format, with e-Invoice IRNs already on the invoices.

This app: GSTR-1 and GSTR-3B render on screen from voucher data. There is no JSON export, no IRN, no e-Way bill, no 2B reconciliation. The last mile — the part the customer is actually paying for — is absent.

Summary: the app has *documents*; Odoo has *document flow plus a ledger*. The gap is one layer deep, not one hundred features wide. Build the ledger and the document-linkage layer (ROADMAP Phase 1–2) and roughly 30 of the “No” rows above stop being independent problems.

3. Where Odoo is genuinely weak (and where this app can win)

Do not read the tables above as “give up”. Odoo’s weaknesses are real and they are the same ones every Indian SMB complains about:

1. **Implementation cost.** Odoo Accounting for a 3-branch distributor is a consultant project, not a signup. Partners typically bill more for the implementation than the first two years of licence.
2. **Per-user pricing.** Every branch accountant, storekeeper, and cashier is a paid seat. A 20-user distributor feels this immediately. A flat per-company or per-branch price is a sharp wedge.
3. **Complexity tax.** Most SMBs use maybe 15% of the accounting app and pay the navigation cost of the other 85% every day.
4. **Branch-level operation is awkward.** Odoo models branches as either separate companies (heavy: separate CoA, inter-company rules) or analytic accounts (weak: not an access boundary). **This app models branch and warehouse as first-class tenancy with per-user access — that is a genuinely better fit for Indian multi-branch retail/distribution, and it is already built.**
5. **India last-mile depends on Enterprise or partners.** Community’s `l10n_in` does not give you a turnkey e-Invoice/e-Way-bill/2B experience.
6. **Speed of data entry.** Odoo’s web client is heavy; a keyboard-first billing screen that a Tally operator can use without retraining is a real product.

The defensible position is not “Odoo but cheaper”. It is: multi-branch Indian GST billing + inventory + compliance filing, opinionated, fast to enter data, flat-priced, with the branch/warehouse permission model built in. That is a product Odoo serves badly and Tally serves without cloud/multi-branch access control.

Competitors that matter more than Odoo for that wedge: **Tally Prime** (incumbent, desktop, huge switching cost), **Zoho Books** (cloud, polished, weak multi-branch inventory), **Vyapar / myBillBook** (cheap mobile billing, no real accounting), **Busy** (multi-branch, desktop). Position against Zoho Books and Busy, not Odoo.

4. What “launch” requires

Feature gaps are only one of six workstreams. Nothing here is optional if real businesses will keep their books in this system.

4.1 PRODUCT MINIMUM (THE NON-NEGOTIABLE SET)

From ROADMAP Phases 0–2, restated as launch gates:

- ☐ Server is the system of record; browser storage is a cache only.
- ☐ Real double-entry GL with posted/draft states and control accounts by ID.
- ☐ Document flow: estimate → invoice → payment allocation; PO → bill → payment.
- ☐ Inventory valuation with COGS posting, or **explicitly ship quantity-only inventory and say so in the pricing page** (a legitimate v1 choice).
- ☐ Period lock + audit trail on every financial mutation.
- ☐ Bank statement import and reconciliation (the #1 reason SMBs abandon a book).
- ☐ GSTR-1/3B in government JSON format; e-Invoice IRN if any customer crosses the turnover threshold; e-Way bill for goods movement.
- ☐ The four P0 security defects from REVIEW.md closed (hardcoded owner email, unguarded invoice routes, cross-account login, unignored secrets).

4.2 DATA AND ONBOARDING

- ☐ Import: Tally XML/Excel, Zoho Books CSV, Busy export, plain Excel templates for masters (customers, vendors, items, opening balances).
- ☐ **Opening balance entry flow** — no business starts on day zero. Trial balance import that posts an opening journal entry.
- ☐ Company setup wizard: GSTIN → auto-fill state/place of supply, CoA selection, branch/warehouse creation, first user + role.
- ☐ Sample/demo company that can be reset — the current `seedDummyDataV1` seeds 75 vouchers into real tenants and should be behind an explicit toggle.
- ☐ Export everything (the customer’s data must be theirs: CSV/Excel of all masters and vouchers, plus a full JSON dump).

4.3 INFRASTRUCTURE AND OPERATIONS

- ☐ Postgres (managed), not SQLite. Staging + production environments.
- ☐ Automated daily backups with a **tested restore** (an untested backup is not a backup) and point-in-time recovery.
- ☐ Monitoring: uptime, error rate, latency, disk. Alerting to a human.
- ☐ Structured logs + error tracking (Sentry), request IDs.
- ☐ CI/CD with migrations applied automatically and a rollback path.
- ☐ Rate limiting, WAF/CDN, TLS, secrets in a manager (not `server/.env`).
- ☐ Published status page and an incident process.
- ☐ Capacity plan: how many orgs per instance, and what happens at 10x.

4.4 SECURITY, LEGAL, COMPLIANCE

- ☐ Password policy, 2FA, session revocation, forced logout on role change.
- ☐ Encryption at rest and in transit; documented data retention and deletion.
- ☐ **DPDP Act 2023 (India)** posture: consent, purpose limitation, breach notification, grievance officer, data-principal rights. Get this reviewed by counsel; it applies to you as a data fiduciary.
- ☐ VAPT / penetration test report — mid-market Indian buyers ask for it.
- ☐ Terms of service, privacy policy, DPA, SLA, refund/cancellation policy.
- ☐ Your own entity, GST registration, and compliant invoicing for the SaaS.
- ☐ A qualified CA on retainer to sign off tax logic **before** customers file from it. Wrong GSTR-1 output is a liability event, not a bug report.
- ☐ Disclaimer + audit trail sufficient for the customer's own statutory audit.

4.5 COMMERCIAL

- ☐ Pricing model. Recommended: per-org base + per-branch, unlimited users — it is the anti-Odoo move and it matches how Indian SMBs think about cost.
- ☐ Subscription billing (Razorpay/Stripe), invoicing, trials, dunning, plan limits enforced in code (branches, warehouses, vouchers/month).
- ☐ Free trial or free tier with a hard, honest limit.
- ☐ Migration offer: “we import your Tally data free” is the single highest- converting line for this category.

- ☐ Channel: chartered accountants and tax practitioners resell/recommend. Build a CA partner portal (multi-client switcher) — Zoho's biggest lever.

4.6 SUPPORT AND CONTENT

- ☐ Documentation and a help centre; in-app contextual help.
- ☐ Onboarding videos in English + Hindi (and ideally one southern language).
- ☐ Support channel with a stated response time; WhatsApp is table stakes in this market.
- ☐ Changelog and a public roadmap.
- ☐ Accounting-correctness test suite as a *marketing asset*: "every release is verified against N ledger and GST scenarios."

4.7 LAUNCH GATE — THE SHORT VERSION

Do not charge money until all of these are true:

1. A customer's data survives losing their laptop.
 2. Two users in two branches see the same books.
 3. A month can be closed and the numbers do not move afterward.
 4. Trial balance foots to zero from posted journal lines.
 5. A GSTR-1 produced by the app has been reconciled against a CA's own computation for at least three real filing cycles.
 6. A restore from backup has been performed successfully into staging.
 7. The P0 security defects are closed and a pen test has been run.
-

5. Realistic sequencing against Odoo

Build now (wedge)	Build later (retention)	Never build (concede to Odoo)
Ledger + document flow	Bank feeds/auto-reconciliation	Manufacturing (MRP)
GST filing last mile (JSON, IRN, e-Way, 2B)	Analytic/cost centres	Ecommerce, website builder
Multi-branch + warehouse access (done)	Assets, deferrals, budgets	HR, payroll, recruitment
Fast keyboard-first billing	Customer portal + online payment	POS hardware ecosystem
Tally/Zoho import	Approval workflows, attachments, chatter	Studio / no-code customization
Bank statement import	Multi-currency	App marketplace
Aged AR/AP, day book	Mobile app	Project/timesheets

Effort, honestly stated. Parity with Odoo Accounting + Inventory for a small team is an 18–30 month program, and it is the wrong goal. The wedge product described in Section 3 — ledger, document flow, GST filing, branch model, import, bank reconciliation — is roughly **6–9 months** on top of ROADMAP Phases 0–2 for one or two developers, and it is sellable.

6. Verdict

The prototype is a **UI-complete demo of an accounting product with an unusually good India-GST computation layer and a genuinely better multi-branch permission model than Odoo's**, sitting on top of no ledger, no persistence guarantee, and no filing capability.

Against Odoo it is not close on breadth and will not become close. Against the product it should be — cloud multi-branch GST billing for Indian SMBs — it is maybe 30–40% of the way there, and the missing 60% is concentrated in two layers (ledger + document flow, then compliance last-mile) rather than scattered across a hundred features. That concentration is good news: it is a build plan, not a rewrite.
